v
Preface

1. Document Conventions
This manual uses several conventions to highlight certain words and phrases and draw attention to specific pieces of information.

In PDF and paper editions, this manual uses typefaces drawn from the Liberation Fonts\(^1\) set. The Liberation Fonts set is also used in HTML editions if the set is installed on your system. If not, alternative but equivalent typefaces are displayed. Note: Red Hat Enterprise Linux 5 and later includes the Liberation Fonts set by default.

1.1. Typographic Conventions
Four typographic conventions are used to call attention to specific words and phrases. These conventions, and the circumstances they apply to, are as follows.

Mono-spaced Bold

Used to highlight system input, including shell commands, file names and paths. Also used to highlight keycaps and key combinations. For example:

To see the contents of the file \texttt{my\_next\_bestselling\_novel} in your current working directory, enter the \texttt{cat my\_next\_bestselling\_novel} command at the shell prompt and press \texttt{Enter} to execute the command.

The above includes a file name, a shell command and a keycap, all presented in mono-spaced bold and all distinguishable thanks to context.

Key combinations can be distinguished from keycaps by the hyphen connecting each part of a key combination. For example:

Press \texttt{Enter} to execute the command.

Press \texttt{Ctrl+Alt+F1} to switch to the first virtual terminal. Press \texttt{Ctrl+Alt+F7} to return to your X-Windows session.

The first paragraph highlights the particular keycap to press. The second highlights two key combinations (each a set of three keycaps with each set pressed simultaneously).

If source code is discussed, class names, methods, functions, variable names and returned values mentioned within a paragraph will be presented as above, in mono-spaced bold. For example:

File-related classes include \texttt{filesystem} for file systems, \texttt{file} for files, and \texttt{dir} for directories. Each class has its own associated set of permissions.

Proportional Bold

This denotes words or phrases encountered on a system, including application names; dialog box text; labeled buttons; check-box and radio button labels; menu titles and sub-menu titles. For example:

\(^1\) https://fedorahosted.org/liberation-fonts/
Choose **System → Preferences → Mouse** from the main menu bar to launch **Mouse Preferences**. In the **Buttons** tab, click the **Left-handed mouse** check box and click **Close** to switch the primary mouse button from the left to the right (making the mouse suitable for use in the left hand).

To insert a special character into a **gedit** file, choose **Applications → Accessories → Character Map** from the main menu bar. Next, choose **Search → Find...** from the **Character Map** menu bar, type the name of the character in the **Search** field and click **Next**. The character you sought will be highlighted in the **Character Table**. Double-click this highlighted character to place it in the **Text to copy** field and then click the **Copy** button. Now switch back to your document and choose **Edit → Paste** from the **gedit** menu bar.

The above text includes application names; system-wide menu names and items; application-specific menu names; and buttons and text found within a GUI interface, all presented in proportional bold and all distinguishable by context.

**Mono-spaced Bold Italic or Proportional Bold Italic**

Whether mono-spaced bold or proportional bold, the addition of italics indicates replaceable or variable text. Italics denotes text you do not input literally or displayed text that changes depending on circumstance. For example:

To connect to a remote machine using ssh, type *ssh username@domain.name* at a shell prompt. If the remote machine is *example.com* and your username on that machine is John, type *ssh john@example.com*.

The `mount -o remount file-system` command remounts the named file system. For example, to remount the `/home` file system, the command is `mount -o remount /home`.

To see the version of a currently installed package, use the `rpm -q package` command. It will return a result as follows: `package-version-release`.

Note the words in bold italics above — username, domain.name, file-system, package, version and release. Each word is a placeholder, either for text you enter when issuing a command or for text displayed by the system.

Aside from standard usage for presenting the title of a work, italics denotes the first use of a new and important term. For example:

Publican is a *DocBook* publishing system.

### 1.2. Pull-quote Conventions

Terminal output and source code listings are set off visually from the surrounding text.

Output sent to a terminal is set in **mono-spaced roman** and presented thus:

```plaintext
books  Desktop  documentation  drafts  mss  photos  stuff  svn
books_tests  Desktop1  downloads  images  notes  scripts  svgs
```

Source-code listings are also set in **mono-spaced roman** but add syntax highlighting as follows:
package org.jboss.book.jca.ex1;
import javax.naming.InitialContext;

public class ExClient
{
  public static void main(String args[])
    throws Exception
  {
    InitialContext iniCtx = new InitialContext();
    Object ref = iniCtx.lookup("EchoBean");
    EchoHome home = (EchoHome) ref;
    Echo echo = home.create();

    System.out.println("Created Echo");

    System.out.println("");
  }
}

1.3. Notes and Warnings
Finally, we use three visual styles to draw attention to information that might otherwise be overlooked.

Note
Notes are tips, shortcuts or alternative approaches to the task at hand. Ignoring a note should have no negative consequences, but you might miss out on a trick that makes your life easier.

Important
Important boxes detail things that are easily missed: configuration changes that only apply to the current session, or services that need restarting before an update will apply. Ignoring a box labeled 'Important' won't cause data loss but may cause irritation and frustration.

Warning
Warnings should not be ignored. Ignoring warnings will most likely cause data loss.

2. We Need Feedback!
If you find a typographical error in this manual, or if you have thought of a way to make this manual better, we would love to hear from you! Please submit a bug report at http://libvirt.org/bugs.html
# Commands listed by group

These are the commands presently available in **virsh**.

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach-device</td>
<td>From libvirt 0.2.3</td>
<td>Attach device from an XML file</td>
</tr>
<tr>
<td>attach-disk</td>
<td>From libvirt 0.3.0</td>
<td>Attach disk device</td>
</tr>
<tr>
<td>attach-interface</td>
<td>From libvirt 0.3.0</td>
<td>Attach network interface</td>
</tr>
<tr>
<td>autostart</td>
<td>From libvirt 0.2.1</td>
<td>Enable and disable the automatic starting of a guest domain when the libvirt daemon starts</td>
</tr>
<tr>
<td>console</td>
<td>From libvirt 0.2.0</td>
<td>Connect the virtual serial console for the guest</td>
</tr>
<tr>
<td>cpu-baseline</td>
<td>From libvirt 0.7.7</td>
<td>Compute baseline CPU</td>
</tr>
<tr>
<td>cpu-compare</td>
<td>From libvirt 0.7.5</td>
<td>Compare host CPU with a CPU described by an XML file</td>
</tr>
<tr>
<td>create</td>
<td>From libvirt 0.1.0</td>
<td>Create a guest domain from an XML file</td>
</tr>
<tr>
<td>define</td>
<td>From libvirt 0.1.6</td>
<td>Define, but don't start, a guest domain from an XML file</td>
</tr>
<tr>
<td>destroy</td>
<td>From libvirt 0.0.1</td>
<td>Immediately terminates a running guest domain, releasing any resources in use by it</td>
</tr>
<tr>
<td>detach-device</td>
<td>From libvirt 0.2.3</td>
<td>Detach a device from an XML file</td>
</tr>
<tr>
<td>detach-disk</td>
<td>From libvirt 0.3.0</td>
<td>Detach a disk device</td>
</tr>
<tr>
<td>detach-interface</td>
<td>From libvirt 0.3.0</td>
<td>Detach a network interface</td>
</tr>
<tr>
<td>domid</td>
<td>From libvirt 0.1.0</td>
<td>Convert a domain name or UUID to domain id</td>
</tr>
<tr>
<td>domjobabort</td>
<td>From libvirt 0.7.7</td>
<td>Aborts the currently running guest domain job</td>
</tr>
<tr>
<td>domjobinfo</td>
<td>From libvirt 0.7.7</td>
<td>Returns information about jobs running on a domain</td>
</tr>
<tr>
<td>domname</td>
<td>From libvirt 0.1.0</td>
<td>Convert a guest domain id or UUID to guest domain name</td>
</tr>
<tr>
<td>domuuuid</td>
<td>From libvirt 0.1.1</td>
<td>Convert a guest domain name or id to guest domain UUID</td>
</tr>
<tr>
<td>Command</td>
<td>Availability</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>domxml-from-native</td>
<td>From libvirt 0.6.4</td>
<td>Convert native guest configuration format to domain XML format</td>
</tr>
<tr>
<td>domxml-to-native</td>
<td>From libvirt 0.6.4</td>
<td>Convert guest domain XML config to a native guest configuration format</td>
</tr>
<tr>
<td>dump</td>
<td>From libvirt 0.1.9</td>
<td>Core dump a guest domain</td>
</tr>
<tr>
<td>dumpxml</td>
<td>From libvirt 0.0.1</td>
<td>Output the guest domain information as an XML dump to stdout</td>
</tr>
<tr>
<td>edit</td>
<td>From libvirt 0.4.6</td>
<td>Edit the XML configuration for a guest domain</td>
</tr>
<tr>
<td>managedsave</td>
<td>From libvirt 0.8.0</td>
<td>Save and destroy a running guest domain, so it can be restarted from the same state at a later time. When the virsh start command is next run for the guest domain, it will automatically be started from this saved state</td>
</tr>
<tr>
<td>managedsave-remove</td>
<td>From libvirt 0.8.3</td>
<td>Remove an existing managed save state file from a guest domain</td>
</tr>
<tr>
<td>maxvcpus</td>
<td>From libvirt 0.8.5</td>
<td>Show maximum number of virtual CPUs for guest domains on this connection</td>
</tr>
<tr>
<td>memtune</td>
<td>From libvirt 0.8.5</td>
<td>Gets or sets the current memory parameters for a guest domain</td>
</tr>
<tr>
<td>migrate</td>
<td>From libvirt 0.3.2</td>
<td>Migrates a guest domain to another host</td>
</tr>
<tr>
<td>migrate-setmaxdowntime</td>
<td>From libvirt 0.8.0</td>
<td>Set maximum tolerable downtime of a guest domain which is being live-migrated to another host</td>
</tr>
<tr>
<td>reboot</td>
<td>From libvirt 0.1.0</td>
<td>Run a reboot command in a guest domain</td>
</tr>
<tr>
<td>restore</td>
<td>From libvirt 0.0.2</td>
<td>Restore a guest domain</td>
</tr>
<tr>
<td>resume</td>
<td>From libvirt 0.0.1</td>
<td>Resume a guest domain</td>
</tr>
<tr>
<td>save</td>
<td>From libvirt 0.0.2</td>
<td>Save the running state of a guest domain to a file</td>
</tr>
<tr>
<td>schedinfo</td>
<td>From libvirt 0.2.3</td>
<td>Show or set scheduler parameters</td>
</tr>
<tr>
<td>Command</td>
<td>Availability</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>--------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>setmaxmem</td>
<td>From libvirt 0.1.4</td>
<td>Change the maximum memory allocation limit in the guest domain</td>
</tr>
<tr>
<td>setmem</td>
<td>From libvirt 0.1.4</td>
<td>Change the current memory allocation in the guest domain</td>
</tr>
<tr>
<td>setvcpus</td>
<td>From libvirt 0.1.4</td>
<td>Change the number of virtual CPUs in the guest domain</td>
</tr>
<tr>
<td>shutdown</td>
<td>From libvirt 0.0.1</td>
<td>Run shutdown in a guest domain</td>
</tr>
<tr>
<td>start</td>
<td>From libvirt 0.1.6</td>
<td>Start a guest domain, either from the last managedsave state, or via a fresh boot if no managedsave state is present</td>
</tr>
<tr>
<td>suspend</td>
<td>From libvirt 0.0.1</td>
<td>Suspend a running guest domain</td>
</tr>
<tr>
<td>ttyconsole</td>
<td>From libvirt 0.3.2</td>
<td>Output the device for the TTY console</td>
</tr>
<tr>
<td>undefine</td>
<td>From libvirt 0.1.6</td>
<td>Remove the configuration for an inactive guest domain</td>
</tr>
<tr>
<td>update-device</td>
<td>From libvirt 0.8.0</td>
<td>Update device from an XML file</td>
</tr>
<tr>
<td>vcpucount</td>
<td>From libvirt 0.8.5</td>
<td>Returns the number of virtual CPUs used by a guest domain</td>
</tr>
<tr>
<td>vcpuserinfo</td>
<td>From libvirt 0.1.4</td>
<td>Returns basic information about a guest domains virtual CPUs</td>
</tr>
<tr>
<td>vcpupin</td>
<td>From libvirt 0.1.4</td>
<td>Pin guest domain virtual CPUs to physical host CPUs</td>
</tr>
<tr>
<td>version</td>
<td>From libvirt 0.0.1</td>
<td>Display the system version information</td>
</tr>
<tr>
<td>vncdisplay</td>
<td>From libvirt 0.2.0</td>
<td>Output the IP address and port number for the VNC display</td>
</tr>
</tbody>
</table>

Table 1.1. Domain management commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domblkinfo</td>
<td>From libvirt 0.8.1</td>
<td>Get block device size info for a guest domain</td>
</tr>
<tr>
<td>domblkstat</td>
<td>From libvirt 0.3.2</td>
<td>Get device block stats for a running guest domain</td>
</tr>
<tr>
<td>domifstat</td>
<td>From libvirt 0.3.2</td>
<td>Get network interface stats for a running guest domain</td>
</tr>
<tr>
<td>dominfo</td>
<td>From libvirt 0.1.0</td>
<td>Returns basic information about a guest domain</td>
</tr>
<tr>
<td>Command</td>
<td>Availability</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>----------------</td>
<td>----------------------------------------------------------</td>
</tr>
<tr>
<td>dommemstat</td>
<td>From libvirt 0.7.5</td>
<td>Get memory statistics for a running guest domain</td>
</tr>
<tr>
<td>domstate</td>
<td>From libvirt 0.1.0</td>
<td>Returns state about a guest domain</td>
</tr>
<tr>
<td>list</td>
<td>From libvirt 0.0.1</td>
<td>Returns a list of guest domains</td>
</tr>
</tbody>
</table>

Table 1.2. Domain monitoring commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capabilities</td>
<td>From libvirt 0.2.1</td>
<td>Returns capabilities of hypervisor/driver</td>
</tr>
<tr>
<td>connect</td>
<td>From libvirt 0.0.1</td>
<td>Connect to local hypervisor</td>
</tr>
<tr>
<td>freecell</td>
<td>From libvirt 0.3.3</td>
<td>Display available free memory for a NUMA cell</td>
</tr>
<tr>
<td>hostname</td>
<td>From libvirt 0.3.0</td>
<td>Display the name of the hypervisor host</td>
</tr>
<tr>
<td>nodeinfo</td>
<td>From libvirt 0.1.0</td>
<td>Returns basic information about the node</td>
</tr>
<tr>
<td>qemu-monitor-command</td>
<td>From libvirt 0.8.6</td>
<td>Qemu monitor command</td>
</tr>
<tr>
<td>uri</td>
<td>From libvirt 0.3.0</td>
<td>Display the hypervisor canonical URI</td>
</tr>
</tbody>
</table>

Table 1.3. Host and hypervisor commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iface-define</td>
<td>From libvirt 0.7.0</td>
<td>Define a physical host network interface</td>
</tr>
<tr>
<td>iface-destroy</td>
<td>From libvirt 0.7.0</td>
<td>Shut down and disable a physical host network interface</td>
</tr>
<tr>
<td>iface-dumpxml</td>
<td>From libvirt 0.7.0</td>
<td>Output information for a physical host network interface, as an XML dump to stdout</td>
</tr>
<tr>
<td>iface-edit</td>
<td>From libvirt 0.7.0</td>
<td>Edit the XML configuration for a physical host network interface</td>
</tr>
<tr>
<td>iface-list</td>
<td>From libvirt 0.7.0</td>
<td>Returns a list of physical host network interfaces</td>
</tr>
<tr>
<td>iface-mac</td>
<td>From libvirt 0.7.0</td>
<td>Returns the MAC address for a physical host network interface</td>
</tr>
<tr>
<td>iface-name</td>
<td>From libvirt 0.7.0</td>
<td>Returns the physical host interface name for a MAC address</td>
</tr>
<tr>
<td>iface-start</td>
<td>From libvirt 0.7.0</td>
<td>Enables and starts a physical host network interface</td>
</tr>
<tr>
<td>Command</td>
<td>Availability</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>iface-undefine</td>
<td>From libvirt 0.7.0</td>
<td>Removes the configuration information for a physical host network interface</td>
</tr>
</tbody>
</table>

Table 1.4. Interface commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nwfilter-define</td>
<td>From libvirt 0.8.0</td>
<td>Define a new network filter or update an existing one</td>
</tr>
<tr>
<td>nwfilter-dumpxml</td>
<td>From libvirt 0.8.0</td>
<td>Output the network filter information as an XML dump to stdout</td>
</tr>
<tr>
<td>nwfilter-edit</td>
<td>From libvirt 0.8.0</td>
<td>Edit the XML configuration for a network filter</td>
</tr>
<tr>
<td>nwfilter-list</td>
<td>From libvirt 0.8.0</td>
<td>Returns the list of network filters</td>
</tr>
<tr>
<td>nwfilter-undefine</td>
<td>From libvirt 0.8.0</td>
<td>Undefine a network filter</td>
</tr>
</tbody>
</table>

Table 1.5. Network filter commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>net-autostart</td>
<td>From libvirt 0.2.1</td>
<td>Enable or disable the automatic starting of a virtual network, when the libvirt daemon starts</td>
</tr>
<tr>
<td>net-create</td>
<td>From libvirt 0.2.0</td>
<td>Creates a new transient virtual network from an XML file</td>
</tr>
<tr>
<td>net-define</td>
<td>From libvirt 0.2.0</td>
<td>Adds a new permanent virtual network from an XML file, without starting it</td>
</tr>
<tr>
<td>net-destroy</td>
<td>From libvirt 0.2.0</td>
<td>Shuts down a running virtual network</td>
</tr>
<tr>
<td>net-dumpxml</td>
<td>From libvirt 0.2.0</td>
<td>Displays the XML configuration for a virtual network (to stdout)</td>
</tr>
<tr>
<td>net-edit</td>
<td>From libvirt 0.4.6</td>
<td>Allows the user to edit the XML configuration of a virtual network, using their preferred editor</td>
</tr>
<tr>
<td>net-info</td>
<td>From libvirt 0.8.6</td>
<td>Displays basic information for a virtual network</td>
</tr>
<tr>
<td>net-list</td>
<td>From libvirt 0.2.0</td>
<td>Lists the virtual networks libvirt is aware of</td>
</tr>
<tr>
<td>net-name</td>
<td>From libvirt 0.2.0</td>
<td>When given a network UUID, returns its corresponding network name</td>
</tr>
<tr>
<td>net-start</td>
<td>From libvirt 0.2.0</td>
<td>Starts a (previously defined) inactive virtual network</td>
</tr>
</tbody>
</table>
## Chapter 1. Commands listed by group

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>net-undefine</td>
<td>From libvirt 0.2.0</td>
<td>Removes an inactive virtual network from the libvirt configuration</td>
</tr>
<tr>
<td>net-uuid</td>
<td>From libvirt 0.2.0</td>
<td>When given a network name, returns its corresponding UUID</td>
</tr>
</tbody>
</table>

Table 1.6. (Virtual) Networking commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodedev-create</td>
<td>From libvirt 0.6.5</td>
<td>Create a device on the physical host, which can then be assigned to a guest domain</td>
</tr>
<tr>
<td>nodedev-destroy</td>
<td>From libvirt 0.6.5</td>
<td>Destroys a device on a physical host</td>
</tr>
<tr>
<td>nodedev-dettach</td>
<td>From libvirt 0.6.1</td>
<td>Dettach a node device from its device driver before assigning to a guest domain</td>
</tr>
<tr>
<td>nodedev-dumpxml</td>
<td>From libvirt 0.5.0</td>
<td>Output the details for a node device as an XML dump to stdout</td>
</tr>
<tr>
<td>nodedev-list</td>
<td>From libvirt 0.5.0</td>
<td>Enumerate devices on the host</td>
</tr>
<tr>
<td>nodedev-reattach</td>
<td>From libvirt 0.6.1</td>
<td>Reattach a node device to its device driver, once released by the guest domain</td>
</tr>
<tr>
<td>nodedev-reset</td>
<td>From libvirt 0.6.1</td>
<td>Reset a node device before or after assigning to a domain</td>
</tr>
</tbody>
</table>

Table 1.7. Node device commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>secret-define</td>
<td>From libvirt 0.7.1</td>
<td>Define or modify a secret</td>
</tr>
<tr>
<td>secret-dumpxml</td>
<td>From libvirt 0.7.1</td>
<td>Output attributes of a secret as an XML dump to stdout</td>
</tr>
<tr>
<td>secret-get-value</td>
<td>From libvirt 0.7.1</td>
<td>Output a secret value to stdout</td>
</tr>
<tr>
<td>secret-list</td>
<td>From libvirt 0.7.1</td>
<td>Returns a list of secrets</td>
</tr>
<tr>
<td>secret-set-value</td>
<td>From libvirt 0.7.1</td>
<td>Set a secret value</td>
</tr>
<tr>
<td>secret-undefine</td>
<td>From libvirt 0.7.1</td>
<td>Undefine a secret</td>
</tr>
</tbody>
</table>

Table 1.8. Secrets, commands for managing them

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>snapshot-create</td>
<td>From libvirt 0.8.0</td>
<td>Creates a snapshot of a domain</td>
</tr>
<tr>
<td>snapshot-current</td>
<td>From libvirt 0.8.0</td>
<td>Gets the current snapshot for a domain</td>
</tr>
<tr>
<td>snapshot-delete</td>
<td>From libvirt 0.8.0</td>
<td>Removes a snapshot, and all of it's children, from a domain</td>
</tr>
<tr>
<td>Command</td>
<td>Availability</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>snapshot-dumpxml</td>
<td>From libvirt 0.8.0</td>
<td>Displays the XML fragment for a domain snapshot</td>
</tr>
<tr>
<td>snapshot-list</td>
<td>From libvirt 0.8.0</td>
<td>Lists the snapshots for a domain</td>
</tr>
<tr>
<td>snapshot-revert</td>
<td>From libvirt 0.8.0</td>
<td>Reverts a domain to a given snapshot</td>
</tr>
</tbody>
</table>

Table 1.9. (Domain) Snapshot commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>find-storage-pool-sources</td>
<td>From libvirt 0.4.6</td>
<td>Discover potential storage pool sources</td>
</tr>
<tr>
<td>find-storage-pool-sources-as</td>
<td>From libvirt 0.4.6</td>
<td>Discover potential storage pool sources</td>
</tr>
<tr>
<td>pool-autostart</td>
<td>From libvirt 0.4.1</td>
<td>Enable or disable the automatic starting of a storage pool, when the libvirt daemon starts</td>
</tr>
<tr>
<td>pool-build</td>
<td>From libvirt 0.4.1</td>
<td>Build a storage pool</td>
</tr>
<tr>
<td>pool-create</td>
<td>From libvirt 0.4.1</td>
<td>Create and start a <em>transient</em> storage pool, that will not persist across system restarts, using settings from an XML file</td>
</tr>
<tr>
<td>pool-create-as</td>
<td>From libvirt 0.4.1</td>
<td>Create and start a <em>transient</em> storage pool, that will not persist across system restarts, using settings passed as options</td>
</tr>
<tr>
<td>pool-define</td>
<td>From libvirt 0.4.1</td>
<td>Add a new <em>persistent</em> storage pool to the configuration, without starting it, using settings from an XML file</td>
</tr>
<tr>
<td>pool-define-as</td>
<td>From libvirt 0.4.1</td>
<td>Add a new <em>persistent</em> storage pool to the configuration, without starting it, using settings passed as options</td>
</tr>
<tr>
<td>pool-delete</td>
<td>From libvirt 0.4.1</td>
<td>Delete a storage pool</td>
</tr>
<tr>
<td>pool-destroy</td>
<td>From libvirt 0.4.1</td>
<td>Shuts down a storage pool (from the libvirt point of view), releasing any resources in use by it</td>
</tr>
<tr>
<td>pool-dumpxml</td>
<td>From libvirt 0.4.1</td>
<td>Displays the XML configuration for a storage pool (to stdout)</td>
</tr>
<tr>
<td>pool-edit</td>
<td>From libvirt 0.4.6</td>
<td>Allows the user to edit the XML configuration of a storage pool, using their preferred editor</td>
</tr>
<tr>
<td>Command</td>
<td>Availability</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>

</table>

Table 1.12. Virsh commands
Index of commands

2.1. attach-device
Attach device from an XML file

Usage
   attach-device

Options
   Needs to be written

Availability
   Available from libvirt 0.2.3 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.2. attach-disk
Attach disk device

Usage
   attach-disk

Options
   Needs to be written

Availability
   Available from libvirt 0.3.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written
2.3. attach-interface

Attach network interface

Usage

attach-interface

Options

Needs to be written

Availability

Available from libvirt 0.3.0 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

See also

Needs to be written

2.4. autostart

Enable and disable the automatic starting of a guest domain when the libvirt daemon starts

Usage

autostart

Options

Needs to be written

Availability

Available from libvirt 0.2.1 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

See also

Needs to be written

2.5. capabilities

Returns capabilities of hypervisor/driver
2.6. cd
Change the current directory

Usage
   cd

Options
   Needs to be written

Availability
   Available from libvirt 0.7.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.7. connect
Connect to local hypervisor

Usage
   connect
Options

  Needs to be written

Availability

  Available from libvirt 0.0.1 onwards

Platform or Hypervisor specific notes

  None yet

Examples

  Needs to be written

Example in context

  Needs to be written

See also

  Needs to be written

2.8. console

Connect the virtual serial console for the guest

Usage

  console

Options

  Needs to be written

Availability

  Available from libvirt 0.2.0 onwards

Platform or Hypervisor specific notes

  None yet

Examples

  Needs to be written

Example in context

  Needs to be written

See also

  Needs to be written

2.9. cpu-baseline

Compute baseline CPU

Usage

  cpu-baseline

Options

  Needs to be written
2.10. cpu-compare

Compare host CPU with a CPU described by an XML file

Usage

cpu-compare

Options

Availability

Available from libvirt 0.7.7 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

Needs to be written

2.11. create

Create a guest domain from an XML file

Usage

create

Options

Availability

Available from libvirt 0.1.0 onwards
Chapter 2. Index of commands

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

See also

Needs to be written

2.12. define

Define, but don’t start, a guest domain from an XML file

Usage

define

Options

Needs to be written

Availability

Available from libvirt 0.1.6 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

See also

Needs to be written

2.13. destroy

Immediately terminates a running guest domain, releasing any resources in use by it

Usage

destroy

Options

Needs to be written

Availability

Available from libvirt 0.0.1 onwards

Platform or Hypervisor specific notes

None yet
2.14. detach-device
Detach a device from an XML file

Usage
   detach-device

Options
   Needs to be written

Availability
   Available from libvirt 0.2.3 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.15. detach-disk
Detach a disk device

Usage
   detach-disk

Options
   Needs to be written

Availability
   Available from libvirt 0.3.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written
Chapter 2. Index of commands

Example in context
   Needs to be written

See also
   Needs to be written

2.16. detach-interface
Detach a network interface

Usage
   detach-interface

Options
   Needs to be written

Availability
   Available from libvirt 0.3.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.17. domblkinfo
Get block device size info for a guest domain

Usage
   domblkinfo

Options
   Needs to be written

Availability
   Available from libvirt 0.8.1 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written
See also
   Needs to be written

2.18. domblkstat
Get device block stats for a running guest domain

Usage
domblkstat

Options
   Needs to be written

Availability
   Available from libvirt 0.3.2 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.19. domid
Convert a domain name or UUID to domain id

Usage
domid

Options
   Needs to be written

Availability
   Available from libvirt 0.1.0 onwards

   Prior to version 0.1.0, this command was known as idof

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written
2.20. domifstat
Get network interface stats for a running guest domain

Usage
   domifstat

Options
   Needs to be written

Availability
   Available from libvirt 0.3.2 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.21. dominfo
Returns basic information about a guest domain

Usage
   dominfo

Options
   Needs to be written

Availability
   Available from libvirt 0.1.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.22. domjobabort
Aborts the currently running guest domain job
Usage
  domjobabort

Options
  Needs to be written

Availability
  Available from libvirt 0.7.7 onwards

Platform or Hypervisor specific notes
  None yet

Examples
  Needs to be written

Example in context
  Needs to be written

See also
  Needs to be written

2.23. domjobinfo
Returns information about jobs running on a domain

Usage
  domjobinfo

Options
  Needs to be written

Availability
  Available from libvirt 0.7.7 onwards

Platform or Hypervisor specific notes
  None yet

Examples
  Needs to be written

Example in context
  Needs to be written

  Needs to be written

2.24. dommemstat
Get memory statistics for a running guest domain

Usage
  dommemstat
2.25. **domname**
Convert a guest domain id or UUID to guest domain name

**Usage**

```
   domname
```

**Options**

*Needs to be written*

**Availability**

Available from libvirt 0.7.5 onwards

Prior to version 0.1.0, this command was known as `nameof`

**Platform or Hypervisor specific notes**

*None yet*

**Examples**

*Needs to be written*

**Example in context**

*Needs to be written*

**See also**

*Needs to be written*

---

2.26. **domstate**
Returns state about a guest domain

**Usage**

```
   domstate
```

**Options**

*Needs to be written*
Availability
Available from libvirt 0.1.0 onwards

Prior to version 0.1.0, this command was known as dstate

Platform or Hypervisor specific notes
None yet

Examples
Needs to be written

Example in context
Needs to be written

See also
Needs to be written

2.27. domuuid
Convert a guest domain name or id to guest domain UUID

Usage
   domuuid

Options
   Needs to be written

Availability
   Available from libvirt 0.1.1 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.28. domxml-from-native
Convert native guest configuration format to domain XML format

Usage
   domxml-from-native

Options
   Needs to be written

Availability
   Available from libvirt 0.6.4 onwards
Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.29. domxml-to-native
Convert guest domain XML config to a native guest configuration format

Usage
   domxml-to-native

Options
   Needs to be written

Availability
   Available from libvirt 0.6.4 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.30. dump
Core dump a guest domain

Usage
   dump

Options
   Needs to be written

Availability
   Available from libvirt 0.1.9 onwards

Platform or Hypervisor specific notes
   None yet
Examples

Needs to be written

Example in context

Needs to be written

See also

Needs to be written

2.31. dumpxml
Output the guest domain information as an XML dump to stdout

Usage

dumpxml

Options

Needs to be written

Availability

Available from libvirt 0.0.1 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

See also

Needs to be written

2.32. echo
Echo back arguments, possibly with quoting

Usage

echo

Options

Needs to be written

Availability

Available from libvirt 0.8.5 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written
Chapter 2. Index of commands

Example in context

*Needs to be written*

See also

*Needs to be written*

### 2.33. edit

Edit the XML configuration for a guest domain

**Usage**

```
edit
```

**Options**

*Needs to be written*

**Availability**

Available from libvirt 0.4.6 onwards

**Platform or Hypervisor specific notes**

*None yet*

**Examples**

*Needs to be written*

Example in context

*Needs to be written*

See also

*Needs to be written*

### 2.34. exit

Quit this interactive terminal. Alternative name for the `quit` command, doing exactly the same thing.

**Usage**

```
exit
```

**Options**

*Needs to be written*

**Availability**

Available from libvirt 0.8.0 onwards

**Platform or Hypervisor specific notes**

*None yet*

**Examples**

*Needs to be written*

Example in context

*Needs to be written*
See also
  Needs to be written

2.35. find-storage-pool-sources-as
Discover potential storage pool sources

Usage
  find-storage-pool-sources-as

Options
  Needs to be written

Availability
  Available from libvirt 0.4.6 onwards

Platform or Hypervisor specific notes
  None yet

Examples
  Needs to be written

Example in context
  Needs to be written

See also
  Needs to be written

2.36. find-storage-pool-sources
Discover potential storage pool sources

Usage
  find-storage-pool-sources

Options
  Needs to be written

Availability
  Available from libvirt 0.4.6 onwards

Platform or Hypervisor specific notes
  None yet

Examples
  Needs to be written

Example in context
  Needs to be written

See also
  Needs to be written
2.37. freecell
Display available free memory for a NUMA cell

Usage
   freecell

Options
   Needs to be written

Availability
   Available from libvirt 0.3.3 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.38. help
Prints global help, command specific help, or help for a group of related commands

Usage
   help

Options
   Needs to be written

Availability
   Available from libvirt 0.0.1 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.39. hostname
Display the name of the hypervisor host
Usage

```
hostname
```

Options

```
Needs to be written
```

Availability

Available from libvirt 0.3.0 onwards

Platform or Hypervisor specific notes

```

2.46. iface-name

Returns the physical host interface name for a MAC address

Usage

iface-name

Options

Needs to be written

Availability

Available from libvirt 0.7.0 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

See also

Needs to be written

2.47. iface-start

Enables and starts a physical host network interface

Usage

iface-start

Options

Needs to be written

Availability

Available from libvirt 0.7.0 onwards

Platform or Hypervisor specific notes

None yet
Examples

   Needs to be written

Example in context

   Needs to be written

See also

   Needs to be written

2.48. iface-undefine

Removes the configuration information for a physical host network interface

Usage

   iface-undefine

Options

   Needs to be written

Availability

   Available from libvirt 0.7.0 onwards

Platform or Hypervisor specific notes

   None yet

Examples

   Needs to be written

Example in context

   Needs to be written

See also

   Needs to be written

2.49. list

Returns a list of guest domains

Usage

   list

Options

   Needs to be written

Availability

   Available from libvirt 0.0.1 onwards

Platform or Hypervisor specific notes

   None yet

Examples

   Needs to be written
2.50. managedsave-remove
Remove an existing managed save state file from a guest domain

Usage
   managedsave-remove

Options
   Needs to be written

Availability
   Available from libvirt 0.8.3 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.51. managedsave
Save and destroy a running guest domain, so it can be restarted from the same state at a later time. When the virsh start command is next run for the guest domain, it will automatically be started from this saved state

Usage
   managedsave

Options
   Needs to be written

Availability
   Available from libvirt 0.8.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written
2.52. maxvcpus
Show maximum number of virtual CPUs for guest domains on this connection

Usage
  maxvcpus

Options
  Needs to be written

Availability
  Available from libvirt 0.8.5 onwards

Platform or Hypervisor specific notes
  None yet

Examples
  Needs to be written

Example in context
  Needs to be written

See also
  Needs to be written

2.53. memtune
Allows you to display or set the memory parameters for a guest domain

Usage
  memtune --domain domain-identifier --hard-limit kb --soft-limit kb --swap-hard-limit kb --min-guarantee kb

Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--domain domain-identifier</td>
<td>required</td>
<td>The name, id, or UUID of the guest domain</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The word &quot;--domain&quot; itself is optional.</td>
</tr>
<tr>
<td>--hard-limit kb</td>
<td>optional</td>
<td>Maximum memory the guest domain can use, in kilobytes. QEMU and LXC only.</td>
</tr>
<tr>
<td>--soft-limit kb</td>
<td>optional</td>
<td>Minimum memory guaranteed for the guest domain during</td>
</tr>
</tbody>
</table>
Chapter 2. Index of commands

### Table 2.1. Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contention in kilobytes</td>
<td></td>
<td>QEMU and LXC only.</td>
</tr>
<tr>
<td>--swap-hard-limit kb</td>
<td>optional</td>
<td>Maximum swap memory the guest domain can use, in kilobytes. QEMU and LXC only.</td>
</tr>
<tr>
<td>--min-guarantee kb</td>
<td>optional</td>
<td>Minimum amount of memory required to start a guest domain, in kilobytes. VMware ESX and vSphere only.</td>
</tr>
</tbody>
</table>

#### Availability

Available from libvirt 0.8.5 onwards

#### Platform or Hypervisor specific notes

**QEMU and LXC**

The `--hard-limit`, `--soft-limit`, and `--swap-hard-limit` parameters are only used by QEMU and LXC.

**VMware ESX and vSphere**

The `--min-guarantee` parameter is only used by VMware ESX and vSphere.

#### Examples

Without flags the current settings are displayed:

```bash
virsh # memtune domain-id
```

This command sets the memory hard limit:

```bash
virsh # memtune domain-id --hard-limit kilobytes
```

This command sets the memory soft limit:

```bash
virsh # memtune domain-id --soft-limit kilobytes
```

This command sets the swap hard limit:

```bash
virsh # memtune domain-id --swap-hard-limit kilobytes
```

Adding the following lines to a guest domain xml file will set the given values for the memory tunables:

```xml
<memtune>
  <hard_limit>131072</hard_limit>
  <soft_limit>65536</soft_limit>
  <swap_hard_limit>262144</swap_hard_limit>
</memtune>
```
Example in context
We run the memtune command giving only a guest domain first, to see what the present values for the domain are:

```
> virsh # memtune lxcbb1
hard_limit     : 131072
soft_limit     : 65536
swap_hard_limit: 262144
```

This shows the value for **hard_limit** is 131072, which means 128MB of memory. To change it to 256MB, we run the memtune command again giving it the new value (256 x 1024 = 262144):

```
> virsh # memtune lxcbb1 --hard-limit 262144
```

Then verify the change has taken effect:

```
> virsh # memtune lxcbb1
hard_limit     : 262144
soft_limit     : 65536
swap_hard_limit: 262144
```

See also
- [http://www.libvirt.org/formatdomain.html#elementsResources](http://www.libvirt.org/formatdomain.html#elementsResources) - Gives the details of the XML needed by `memtune`.

### 2.54. `migrate-setmaxdowntime`
Set maximum tolerable downtime of a guest domain which is being live migrated to another host

**Usage**

```
migrate-setmaxdowntime
```

**Options**

- Needs to be written

**Availability**

Available from libvirt 0.8.0 onwards

**Platform or Hypervisor specific notes**

- None yet

**Examples**

- Needs to be written

**Example in context**

- Needs to be written

**See also**

- Needs to be written
2.55. migrate

Migrates a guest domain to another host

Usage

\texttt{migrate}

Options

\textit{Needs to be written}

Availability

Available from libvirt 0.3.2 onwards

Platform or Hypervisor specific notes

\textit{None yet}

Examples

\textit{Needs to be written}

\textit{Needs to be written}

See also

\textit{Needs to be written}

2.56. net-autostart

Enables or disables the automatic startup of a \textbf{persistent} virtual network, by the libvirt daemon.

Usage

\begin{verbatim}
net-autostart --network network-identifier --disable
\end{verbatim}

Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--network network-identifier</td>
<td>required</td>
<td>The name or UUID for the virtual network being configured. The word &quot;--network&quot; itself is optional.</td>
</tr>
<tr>
<td>--disable</td>
<td>optional</td>
<td>Disables the automatic starting of the virtual network.</td>
</tr>
</tbody>
</table>

Table 2.2. Options

Availability

Available from libvirt 0.2.1 onwards

Platform or Hypervisor specific notes

\textit{None yet}

Examples
virsh # net-autostart default --disable

Stops the virtual network named "default" from automatically starting when the libvirt daemon starts.

virsh # net-autostart --network default --disable

Same as the above example.

virsh # net-autostart bfbc4c69-7d6a-cc9a-904c-09910ce179c0 --disable

Stops the virtual network with UUID "bfbc4c69-7d6a-cc9a-904c-09910ce179c0" from automatically starting when the libvirt daemon starts.

virsh # net-autostart --network bfbc4c69-7d6a-cc9a-904c-09910ce179c0 --disable

Same as the above example.

virsh # net-autostart default

Enables the automatic starting of the virtual network named "default", by the libvirt daemon when it starts.

virsh # net-autostart --network default

Same as the above example.

Example in context

Starting with an XML file we've already created, using the required XML format:\n
```xml
<network>
  <name>examplenetwork</name>
  <bridge name="virbr100" />
  <forward mode="route" />
  <ip address="10.10.120.1" netmask="255.255.255.0" />
</network>
```

# ls -al /root/examplenetwork.xml
-rw-r--r--. 1 root root 162 Nov  7 16:43 /root/examplenetwork.xml

We start virsh interactively, then define a persistent virtual network:

# virsh
Welcome to virsh, the virtualization interactive terminal.

1 http://libvirt.org/formatnetwork.html
Chapter 2. Index of commands

Type:  'help' for help with commands
       'quit' to quit

virsh # net-list
Name          State  Autostart
--------------------------
default      active   yes

virsh # net-define /root/examplenetwork.xml
Network examplenetwork defined from /root/examplenetwork.xml

Newly defined virtual networks aren't set to automatically be started, as can be seen here:

virsh # net-list --all
Name          State  Autostart
--------------------------
default      active   yes
examplenetwork      inactive  no  <-- this is the important piece

We enable automatic starting for it:

virsh # net-autostart examplenetwork
Network examplenetwork marked as autostarted

Checking, to make sure:

virsh # net-list --all
Name          State  Autostart
--------------------------
default      active   yes
examplenetwork      inactive  yes  <-- this is the important piece

From now on, whenever the libvirt daemon is started, it will automatically start this virtual network too (unless it's already running). If at some point we want to turn off automatic starting of the virtual network, we use the --disable option to the command:

# net-autostart --disable examplenetwork
Network examplenetwork unmarked as autostarted

virsh # net-list --all
Name          State  Autostart
--------------------------
default      active   yes
examplenetwork      inactive  no  <-- this is the important piece

See also
- net-dumpxml - Outputs the XML configuration for a virtual network, to stdout.
- net-list - Lists the virtual networks libvirt is aware of.
2.57. net-create

Creates a running, transient virtual network, using settings from an XML file.

Usage

```
net-create --file file-name
```

Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--file file-name</td>
<td>required</td>
<td>The full path (and file name) to an XML file containing the network settings required.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The word &quot;--file&quot; itself is optional.</td>
</tr>
</tbody>
</table>

Table 2.3. Options

Availability

Available from libvirt 0.2.0 onwards

Platform or Hypervisor specific notes

None yet

Examples

```
virsh # net-create /root/examplenetwork.xml
```

Creates a new, transient, virtual network using the settings from /root/examplenetwork.xml.

```
virsh # net-create --file /root/examplenetwork.xml
```

Same as the above example.

Example in context

Starting with an XML file we've already created, using the required XML format:

```
<network>
  <name>examplenetwork</name>
  <bridge name="virbr100" />
  <forward mode="route" />
  <ip address="10.10.120.1" netmask="255.255.255.0" />
</network>
```

```
# ls -al /root/examplenetwork.xml
-rw-r--r--. 1 root root 162 Nov  7 16:43 /root/examplenetwork.xml
```

We start virsh interactively, then create the transient virtual network:

3 http://libvirt.org/formatnetwork.html
Chapter 2. Index of commands

# virsh
Welcome to virsh, the virtualization interactive terminal.
Type: 'help' for help with commands
'quit' to quit

virsh # net-list
Name                  State     Autostart
-------------------------------
default              active     yes

virsh # net-create /root/examplenetwork.xml
Network examplenetwork created from /root/examplenetwork.xml

Created. Now we confirm:

virsh # net-list
Name                  State     Autostart
-------------------------------
default              active     yes
examplenetwork        active     no

We check the details of the created network from virsh. This shows us the generated UUID, and anything else that may be in effect (ie Spanning Tree Protocol).

virsh # net-dumpxml examplenetwork
<network>
  <name>examplenetwork</name>
  <uuid>97ce3914-231e-4026-0a78-822e1e2e7226</uuid>
  <forward mode='route'/>
  <bridge name='virbr100' stp='on' delay='0' />
  <ip address='10.10.120.1' netmask='255.255.255.0'>
  </ip>
</network>

Then, after exiting virsh, we check how it appears to the host Linux OS:

# ifconfig virbr100
virbr100  Link encap:Ethernet  HWaddr 02:95:C3:06:A5:BF
  inet addr:10.10.120.1  Bcast:10.10.120.255  Mask:255.255.255.0
  UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
  RX packets:0 errors:0 dropped:0 overruns:0 frame:0
  TX packets:11 errors:0 dropped:0 overruns:0 carrier:0
  collisions:0 txqueuelen:0
  RX bytes:0 (0.0 b)  TX bytes:2653 (2.5 KiB)

See also
• net-define - An alternative to net-create. Use this when you want a persistent virtual network that will last through reboots and shutdowns, rather than a transient one created using net-create.
• **net-destroy** - shuts down a running virtual network, as started with **net-create** or **net-start**.

• [http://libvirt.org/formatnetwork.html](http://libvirt.org/formatnetwork.html) - gives the details of the XML needed by **net-create**.

### 2.58. net-define

Adds a new persistent virtual network to libvirt, without starting it, using settings from an XML file.

You will need to manually start this virtual network when needed using **net-start**, unless you enable automatic starting for it. If you enable automatic starting, the virtual network will be started when the libvirt daemon starts.

To enable automatic starting of this virtual network, use the **net-autostart** command.

**Usage**

```
net-define --file file-name
```

**Options**

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>--file</strong> file-name</td>
<td>required</td>
<td>the full path (and file name) to an XML file containing the network settings required(^4). The word &quot;<strong>--file</strong>&quot; itself is optional.</td>
</tr>
</tbody>
</table>

Table 2.4. Options

**Availability**

Available from libvirt 0.2.0 onwards

**Platform or Hypervisor specific notes**

None yet

**Examples**

```
virsh # net-define /root/examplenetwork.xml
```

Creates a new, persistent, virtual network using the settings from the XML file /root/examplenetwork.xml.

```
virsh # net-define --file /root/examplenetwork.xml
```

Same as the above example.

**Example in context**

Starting with an XML file we've already created, using the [required XML format](http://libvirt.org/formatnetwork.html)\(^5\):

```
<network>
  <name>examplenetwork</name>
</network>
```

\(^4\) [http://libvirt.org/formatnetwork.html](http://libvirt.org/formatnetwork.html)
We start virsh interactively, then create the transient virtual network:

```
# virsh
Welcome to virsh, the virtualization interactive terminal.
Type: 'help' for help with commands
      'quit' to quit

virsh # net-list
Name             State      Autostart
-----------------------------
default           active     yes

virsh # net-define /root/examplenetwork.xml
Network examplenetwork defined from /root/examplenetwork.xml

Defined. Now we confirm:

virsh # net-list --all
Name             State      Autostart
-----------------------------
default           active     yes
examplenetwork   inactive   no

Newly defined virtual networks aren't automatically started, so we manually start it now:

virsh # net-start examplenetwork
Network examplenetwork started

virsh # net-list
Name             State      Autostart
-----------------------------
default           active     yes
examplenetwork   active     no

We check the details of the started network from virsh. This shows us the generated UUID, and anything else that may be in effect (ie Spanning Tree Protocol).

virsh # net-dumpxml examplenetwork
<network>
  <name>examplenetwork</name>
</network>
```
If the virtualisation server is running Linux, we can check how it appears to the host OS:

```
# ifconfig virbr100
virbr100  Link encap:Ethernet  HWaddr A6:45:97:AE:8E:08
          inet addr:10.10.120.1  Bcast:10.10.120.255  Mask:255.255.255.0
          UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
          RX packets:0 errors:0 dropped:0 overruns:0 frame:0
          TX packets:11 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:0
          RX bytes:0 (0.0 b)  TX bytes:2653 (2.5 KiB)
```

See also
- **net-autostart** - Used to enable and disable the automatic starting of a virtual network.
- **net-create** - An alternative to **net-define**. Use this when you want a transient virtual network that will disappear when the host is rebooted or shutdown, rather than a persistent one created using **net-define**.
- **net-destroy** - Shuts down a running virtual network, as started with **net-create** or **net-start**.
- **net-start** - Manually starts a virtual network that isn't running.
- **http://libvirt.org/formatnetwork.html** - Gives the details of the XML needed by **net-define**.

### 2.59. net-destroy

Shuts down a virtual network, releasing any resources in use by it.

**Usage**
```
net-destroy --network network-identifier
```

**Options**

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--network network-identifier</td>
<td>required</td>
<td>The name or UUID of the network to be shut down.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The word &quot;--network&quot; itself is optional.</td>
</tr>
</tbody>
</table>

**Table 2.5. Options**

**Availability**
Available from libvirt 0.2.0 onwards

**Platform or Hypervisor specific notes**
**Linux**

If the virtualisation host is running Linux, the name the operating system uses for the network interface can be found using the **net-dumpxml** virsh command.
Look for the name value of the `bridge` line. `virbr100` in this instance:

```
virsh # net-dumpxml examplenetwork
<network>
  <name>examplenetwork</name>
  <uuid>b7005dec-be1a-fe9a-338a-0cb1301dfcfd</uuid>
  <forward mode='route'/>
  <bridge name='virbr100' stp='on' delay='0' />
  <ip address='10.10.120.1' netmask='255.255.255.0'/>
</network>
```

Using `ifconfig`, or a similar tool such as `ip`, the `virbr100` interface will be seen on the host when the virtual network is running:

```
# ifconfig virbr100
virbr100 Link encap:Ethernet  HWaddr D2:43:D9:47:FA:AA
inet addr:10.10.120.1  Bcast:10.10.120.255  Mask:255.255.255.0
UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
RX packets:0 errors:0 dropped:0 overruns:0 frame:0
TX packets:7 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueuelen:0
RX bytes:0 (0.0 b)  TX bytes:1553 (1.5 KiB)
```

After shutting down a virtual network with the `net-destroy` command, the Linux OS will no longer show this interface:

```
# ifconfig virbr100
virbr100: error fetching interface information: Device not found
```

Examples

```
virsh # net-destroy mynetwork
Shuts down the virtual network named "mynetwork".
```

```
virsh # net-destroy --network mynetwork
Same as the above example.
```

```
virsh # net-destroy bfbc4c69-7d6a-cc9a-904c-09910ce179c0
Shuts down the virtual network that has a UUID of "bfbc4c69-7d6a-cc9a-904c-09910ce179c0".
```

```
virsh # net-destroy --network bfbc4c69-7d6a-cc9a-904c-09910ce179c0
Same as the above example.
```
Example in context

Starting with a virtual network named `examplenetwork`, already running on a virtualisation host server:

```
# net-list
Name                 State      Autostart
-----------------------------------------
default              active     yes
examplenetwork       active     yes
```

The network is shut down by simply using the `net-destroy` command on it:

```
# net-destroy examplenetwork
Network examplenetwork destroyed
```

The command now shows it as inactive:

```
# net-list --all
Name                 State      Autostart
-----------------------------------------
default              active     yes
examplenetwork       inactive   yes
```

See also

- `net-create` - Creates a running, **transient** virtual network, using settings from an XML file.
- `net-list` - Displays a list of the virtual networks libvirt is aware of.
- `net-start` - Manually starts a virtual network that isn't running.

### 2.60. `net-dumpxml`

Outputs the XML configuration for a virtual network, to stdout.

**Usage**

```
net-dumpxml --network network-identifier
```

**Options**

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--network network-identifier</code></td>
<td>required</td>
<td>The name or UUID of the network whose XML configuration is to be displayed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The word <code>--network</code> itself is optional.</td>
</tr>
</tbody>
</table>

**Availability**

Available from libvirt 0.2.0 onwards
Chapter 2. Index of commands

Platform or Hypervisor specific notes

None yet

Examples

```
virsh # net-dumpxml mynetwork
```

Outputs the XML configuration for the virtual network named “mynetwork”.

```
virsh # net-dumpxml --network mynetwork
```

Same as the above example.

```
virsh # net-dumpxml bfbc4c69-7d6a-cc9a-904c-9910ce179c0
```

Outputs the XML configuration for the virtual network that has a UUID of "bfbc4c69-7d6a-cc9a-904c-9910ce179c0".

```
virsh # net-dumpxml --network bfbc4c69-7d6a-cc9a-904c-9910ce179c0
```

Same as the above example.

Example in context

Starting with a few virtual networks already defined:

```
virsh # net-list --all
Name                State   Autostart
-----------------------------
default             active   yes
examplenetwork      active   no
```

We use `net-dumpxml` to look at the XML configuration for “examplenetwork”:

```
virsh # net-dumpxml examplenetwork
<network>
  <name>examplenetwork</name>
  <uuid>b7085dec-be1a-fe9a-338a-0cb1301dfcfd</uuid>
  <forward mode='route'/>
  <bridge name='virbr100' stp='on' delay='0' />
  <ip address='10.10.120.1' netmask='255.255.255.0'/>
</network>
```

Done.

See also

- **net-list** - Displays a list of the virtual networks libvirt is aware of.
2.61. net-edit

Allows the user to edit the XML configuration of a virtual network, using their preferred editor.

`net-edit` launches the command (or script) is defined in the user's `$EDITOR` environment variable, passing it a temporary copy of the XML configuration for the virtual network.

When the user exits the editor, `net-edit` checks if the temporary file was changed.

If it was, then `net-edit` validates it to ensure it's error free. If no errors are found, `net-edit` then overwrites the existing saved virtual network configuration using it.

Usage

```
net-edit --network network-identifier
```

Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--network network-identifier</code></td>
<td>required</td>
<td>The name or UUID of the virtual network whose XML configuration is to be edited.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The word &quot;--network&quot; itself is optional.</td>
</tr>
</tbody>
</table>

Table 2.7. Options

Availability

Available from libvirt 0.4.6 onwards

Platform or Hypervisor specific notes

None yet

Examples

```
virsh # net-edit mynetwork
```

Edits the XML configuration for the virtual network named "mynetwork".

```
virsh # net-edit --network mynetwork
```

Same as the above example.

```
virsh # net-edit bfbc4c69-7d6a-cc9a-904c-09910ce179c0
```

Edits the XML configuration for the virtual network having UUID "bfbc4c69-7d6a-cc9a-904c-09910ce179c0".

```
virsh # net-edit --network bfbc4c69-7d6a-cc9a-904c-09910ce179c0
```
Same as the above example.

Example in context
Starting with a few virtual networks already defined:

```
virsh # net-list --all
Name             State   Autostart
----------------- -------- --------
default          active   yes
examplenetwork   active   no
```

We use `net-dumpxml` to view the XML configuration for "examplenetwork":

```
virsh # net-dumpxml examplenetwork
<network>
  <name>examplenetwork</name>
  <uuid>b7005dec-be1a-fe9a-338a-0cb1301dfcfd</uuid>
  <forward mode='route'/>
  <bridge name='virbr100' stp='on' delay='0' />
  <ip address='10.10.120.1' netmask='255.255.255.0'/>
</network>
```

We want to change one of the values, for example, the Spanning Tree Protocol delay of 0. Let's say want it to be 30 (seconds) instead.

Using `net-edit`, we launch an editor on the XML fragment. (`vi` is the editor shown):

```
virsh # net-edit examplenetwork
```

The editor window appears, and we make the change directly:

```
<network>
  <name>examplenetwork</name>
  <uuid>b7005dec-be1a-fe9a-338a-0cb1301dfcfd</uuid>
  <forward mode='route'/>
  <bridge name='virbr100' stp='on' delay='30'/>
  <ip address='10.10.120.1' netmask='255.255.255.0'/>
</network>
```

Then save the (temporary) file and exit the editor. `net-edit` automatically copies the temporary XML to the saved configuration, if no errors in it were detected.

```
Network examplenetwork XML configuration edited.
```
The next time the "example-network" virtual network is started, it will use the new value.

See also

- *net-dumpxml* - Outputs the XML configuration for a virtual network, to stdout.
- *net-list* - Displays a list of the virtual networks libvirt is aware of.

## 2.62. net-info

Displays basic information for a virtual network.

### Usage

```
net-info --network network-identifier
```

### Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--network network-identifier</code></td>
<td>required</td>
<td>The name or UUID of the virtual network to display information for.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The word &quot;--network&quot; itself is optional.</td>
</tr>
</tbody>
</table>

### Table 2.8. Options

### Availability

Available from libvirt 0.8.6 onwards

### Platform or Hypervisor specific notes

*None yet*

### Examples

```
virsh # net-info default
Name           default
UUID           1c42888c-82c9-4dda-bc9c-4387962a0c0e
Active:        yes
Persistent:    yes
Autostart:     yes
Bridge:        virbr0
```

Displays basic information for the virtual network named "default".

If the host server is running Linux, then the **Bridge** field gives the name of the Linux network bridge being for the virtual network.

```
virsh # net-info --network default
Name           default
UUID           1c42888c-82c9-4dda-bc9c-4387962a0c0e
Active:        yes
Persistent:    yes
Autostart:     yes
```
Chapter 2. Index of commands

Bridge: virbr0

Same as the above example.

Example in context

We begin with an existing virtual network, running on the host:

```
# net-list --all
```

<table>
<thead>
<tr>
<th>Name</th>
<th>State</th>
<th>Autostart</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>active</td>
<td>yes</td>
</tr>
</tbody>
</table>

The virtual network "default" is active and enabled for automatic starting.

We use the `net-info` command to display further details:

```
# net-info default
```

Name: default
UUID: 1c42888c-82c9-4dda-bc9c-4387962a0c0e
Active: yes
Persistent: yes
Autostart: yes
Bridge: virbr0

Some of the same information can also be retrieved using the `net-dumpxml` command, then looking through the output:

```
virsh # net-dumpxml default
<network>
  <name>default</name>
  <uuid>1c42888c-82c9-4dda-bc9c-4387962a0c0e</uuid>
  <forward mode='nat'/>
  <bridge name='virbr0' stp='on' delay='0'/>
  <ip address='192.168.122.1' netmask='255.255.255.0'>
    <dhcp>
      <range start='192.168.122.2' end='192.168.122.254'/>
    </dhcp>
  </ip>
</network>
```

See also
- `net-dumpxml` - Outputs the XML configuration for a virtual network, to stdout
- `net-list` - Lists the virtual networks libvirt is aware of

2.63. `net-list`

Lists the virtual networks libvirt is aware of, along with basic status and autostart information.

Used without parameters, `net-list` displays information for only active virtual networks.

Usage

```
net-list --all --inactive
```
Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--all</td>
<td>optional</td>
<td>Instructs <code>net-list</code> to display both active and inactive virtual networks.</td>
</tr>
<tr>
<td>--inactive</td>
<td>optional</td>
<td>Instructs <code>net-list</code> to only display inactive virtual networks.</td>
</tr>
</tbody>
</table>

Table 2.9. Options

Availability
Available from libvirt 0.2.0 onwards

Platform or Hypervisor specific notes
None yet

Examples

```
virsh # net-list
```
Displays the active libvirt virtual networks.

```
virsh # net-list --all
```
Displays all virtual networks libvirt knows of, both active and inactive.

```
virsh # net-list --inactive
```
Displays only the inactive libvirt virtual networks.

Example in context
Displaying all of the libvirt virtual networks on a host:

```
virsh # net-list --all
```

<table>
<thead>
<tr>
<th>Name</th>
<th>State</th>
<th>Autostart</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>active</td>
<td>yes</td>
</tr>
<tr>
<td>examplenetwork</td>
<td>inactive</td>
<td>no</td>
</tr>
</tbody>
</table>

See also

- `net-autostart` - Used to enable and disable the automatic starting of a virtual network.
- `net-destroy` - Shuts down a running virtual network, as started with `net-create` or `net-start`.
- `net-start` - Manually starts a virtual network that isn't running.

### 2.64. net-name

When given a virtual network UUID, returns its corresponding virtual network name.
## Chapter 2. Index of commands

### Usage

```
net-name --network network-UUID
```

### Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--network network-UUID</code></td>
<td>required</td>
<td>The UUID of the virtual network you want the name for.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The word &quot;--network&quot; itself is optional.</td>
</tr>
</tbody>
</table>

Table 2.10. Options

### Availability

Available from libvirt 0.2.0 onwards

### Platform or Hypervisor specific notes

None yet

### Examples

```
virsh # net-name b7005dec-be1a-fe9a-338a-0cb1301dfcfd
```

Returns the name of the virtual network having a UUID of "b7005dec-be1a-fe9a-338a-0cb1301dfcfd".

```
virsh # net-name --network b7005dec-be1a-fe9a-338a-0cb1301dfcfd
```

Same as the above example.

### Example in context

Given a virtual network UUID, we can determine which virtual network it belongs to:

```
virsh # net-name b7005dec-be1a-fe9a-338a-0cb1301dfcfd examplenetwork
```

We can confirm by using the `net-dumpxml` command on the returned network name:

```
virsh # net-dumpxml examplenetwork

<network>
  <name>examplenetwork</name>  <!-- the name is here
  <uuid>b7005dec-be1a-fe9a-338a-0cb1301dfcfd</uuid>  <!-- the UUID is here
  <forward mode='route'/>
  <bridge name='virbr100' stp='on' delay='1' />
  <ip address='10.10.120.1' netmask='255.255.255.0'>
  </ip>
</network>
```

Using `net-name` is more efficient than dumping the XML for the virtual network and manually extracting the `name` value.
See also
• net-dumpxml - Outputs the XML configuration for a virtual network, to stdout

2.65. net-start
Starts an inactive, previously defined, virtual network.

Usage
net-start --network network-identifier

Options

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--network network-identifier</td>
<td>required</td>
<td>The name or UUID of the virtual network to start.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The word &quot;--network&quot; itself is optional.</td>
</tr>
</tbody>
</table>

Table 2.11. Options

Availability
Available from libvirt 0.2.0 onwards

Platform or Hypervisor specific notes
None yet

Examples

virsh # net-start examplenetwork
Starts the virtual network named "examplenetwork".

virsh # net-start --network examplenetwork
Same as the above example.

virsh # net-start b7005dec-be1a-fe9a-338a-0cb1301dfcfd
Starts the virtual network that has a UUID of "b7005dec-be1a-fe9a-338a-0cb1301dfcfd".

virsh # net-start --network b7005dec-be1a-fe9a-338a-0cb1301dfcfd
Same as the above example.

Example in context
Starting with an XML file we've already created, using the required XML format:

http://libvirt.org/formatnetwork.html
Chapter 2. Index of commands

We start `virsh` interactively, then define a **persistent** virtual network using the XML file:

```
# virsh
Welcome to virsh, the virtualization interactive terminal.
Type:  'help' for help with commands
       'quit' to quit

virsh # net-list
Name                 State      Autostart
-----------------------------------------
default              active     yes

virsh # net-define /root/examplenetwork.xml
Network examplenetwork defined from /root/examplenetwork.xml

Defined. Now we confirm:

virsh # net-list --all
Name                 State      Autostart
-----------------------------------------
default              active     yes
examplenetwork       inactive   no       <-- new persistent networks start out inactive

Newly defined virtual networks aren't automatically started, so we manually start it now:

virsh # net-start examplenetwork       <-- this is net-start in action
Network examplenetwork started

virsh # net-list
Name                 State      Autostart
-----------------------------------------
default              active     yes
examplenetwork       active      no       <-- the persistent network is now running

We check the details of the started network from `virsh`, using `net-dumpxml`. This shows us the name of the bridge network interface.
If the virtualisation server is running Linux, we can check how the bridge interface appears to the host OS:

```bash
# ifconfig virbr100
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--network</td>
<td>required</td>
<td>The name or UUID of the virtual network to remove. The word &quot;--network&quot; itself is optional.</td>
</tr>
</tbody>
</table>

### 2.66. net-undefine

Removes an inactive virtual network from the libvirt configuration.

**Usage**

```
net-undefine --network network-identifier
```

**Options**

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--network</td>
<td>required</td>
<td>The name or UUID of the virtual network to remove. The word &quot;--network&quot; itself is optional.</td>
</tr>
</tbody>
</table>

**Availability**

Available from libvirt 0.2.0 onwards

**Platform or Hypervisor specific notes**

None yet
Examples

```
virsh # net-undefine examplenetwork
```

Undefines the virtual network named "examplenetwork".

```
virsh # net-undefine --network examplenetwork
```

Same as the above example.

```
virsh # net-undefine b7005dec-be1a-fe9a-338a-0cb1301dfcfd
```

Undefines the virtual network having a UUID of "b7005dec-be1a-fe9a-338a-0cb1301dfcfd".

```
virsh # net-undefine --network b7005dec-be1a-fe9a-338a-0cb1301dfcfd
```

Same as the above example.

Example in context

Starting with a virtual network named `examplenetwork`, already running on a virtualisation host server:

```
virsh # net-list
Name                 State      Autostart
-----------------------------------------
default              active     yes
examplenetwork       active     yes
```

The virtual network is running (active), so we need to shut it down before removing it. We use the `net-destroy` command to shut it down:

```
# net-destroy examplenetwork
Network examplenetwork destroyed
```

Then remove it using `net-undefine`:

```
virsh # net-undefine examplenetwork          <-- this is net-undefine in action
Network examplenetwork has been undefined
```

Done. The `net-list` command no longer shows it listed:

```
virsh # net-list --all
Name                 State      Autostart
-----------------------------------------
default              active     yes
```
See also
- `net-define` - Adds a new persistent virtual network to libvirt, without starting it, using settings from an XML file.
- `net-destroy` - Shuts down a running virtual network, as started with `net-create` or `net-start`.
- `net-list` - Displays a list of the virtual networks libvirt is aware of.

### 2.67. net-uuid

When given a network name, returns its corresponding UUID.

**Usage**

```
net-uuid --network network-name
```

**Options**

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--network network-name</code></td>
<td>required</td>
<td>The name of the virtual network you want the UUID for.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The word &quot;<code>--network</code>&quot; itself is optional.</td>
</tr>
</tbody>
</table>

**Table 2.13. Options**

**Availability**

Available from libvirt 0.2.0 onwards

**Platform or Hypervisor specific notes**

None yet

**Examples**

```
virsh # net-uuid mynetwork
fa3642ab-e113-7eaa-528f-14ed78bca20
```

Returns the UUID of the virtual network named "mynetwork".

```
virsh # net-uuid --network mynetwork
fa3642ab-e113-7eaa-528f-14ed78bca20
```

Same as the previous example.

**Example in context**

Given a virtual network name, we can get its UUID:

```
virsh # net-uuid examplenetwork
bfbc4c69-7d6a-cc9a-904c-09910ce179c0
```

We can confirm by using the `net-dumpxml` command on the returned network UUID:
Chapter 2. Index of commands

virsh # net-dumpxml bfbc4c69-7d6a-cc9a-904c-09910ce179c0
<network>
  <name>examplenetwork</name><!-- the name is here
  <uuid>b7005dec-be1a-fe9a-338a-0cb1301d0fcf</uuid><!-- the UUID is here
  <forward mode='route'/>
  <bridge name='virbr100' stp='on' delay='1'/>
  <ip address='10.10.120.1' netmask='255.255.255.0'/>
</network>

Using net-uuid is more efficient than dumping the XML for the virtual network and manually extracting the uuid value.

See also
- net-dumpxml - Outputs the XML configuration for a virtual network, to stdout
- net-list - Lists the virtual networks libvirt is aware of

2.68. nodedev-create

Create a device on the physical host, which can then be assigned to a guest domain

Usage
   nodedev-create

Options
   Needs to be written

Availability
   Available from libvirt 0.6.5 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.69. nodedev-destroy

Destroys a device on a physical host

Usage
   nodedev-destroy

Options
   Needs to be written
2.70. nodedev-dettach

Detach a node device from its device driver before assigning to a guest domain

Usage
   nodedev-dettach

Options
   Needs to be written

Availability
   Available from libvirt 0.6.1 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.71. nodedev-dumpxml

Output the details for a node device as an XML dump to stdout

Usage
   nodedev-dumpxml

Options
   Needs to be written

Availability
   Available from libvirt 0.5.0 onwards
Chapter 2. Index of commands

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.72. nodedev-list
Enumerate devices on the host

Usage
   nodedev-list

Options
   Needs to be written

Availability
   Available from libvirt 0.5.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.73. nodedev-reattach
Reattach a node device to its device driver, once released by the guest domain

Usage
   nodedev-reattach

Options
   Needs to be written

Availability
   Available from libvirt 0.6.1 onwards

Platform or Hypervisor specific notes
   None yet
2.74. nodedev-reset
Reset a node device before or after assigning to a domain

Usage
```
nodedev-reset
```

Options
```
Needs to be written
```

Availability
```
Available from libvirt 0.6.1 onwards
```

Platform or Hypervisor specific notes
```
None yet
```

Examples
```
Needs to be written
```

Example in context
```
Needs to be written
```

See also
```
Needs to be written
```

2.75. nodeinfo
Returns basic information about the node

Usage
```
nodeinfo
```

Options
```
Needs to be written
```

Availability
```
Available from libvirt 0.1.0 onwards
```

Platform or Hypervisor specific notes
```
None yet
```

Examples
```
Needs to be written
```
Chapter 2. Index of commands

Example in context

*Needs to be written*

See also

*Needs to be written*

2.76. nwfilter-define
Define a new network filter or update an existing one

Usage

```
nwfilter-define
```

Options

*Needs to be written*

Availability

Available from libvirt 0.8.0 onwards

Platform or Hypervisor specific notes

*None yet*

Examples

*Needs to be written*

Example in context

*Needs to be written*

See also

*Needs to be written*

2.77. nwfilter-dumpxml
Output the network filter information as an XML dump to stdout

Usage

```
nwfilter-dumpxml
```

Options

*Needs to be written*

Availability

Available from libvirt 0.8.0 onwards

Platform or Hypervisor specific notes

*None yet*

Examples

*Needs to be written*

Example in context

*Needs to be written*
See also
   Needs to be written

2.78. nwfilter-edit
Edit the XML configuration for a network filter

Usage
   nwfilter-edit

Options
   Needs to be written

Availability
   Available from libvirt 0.8.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.79. nwfilter-list
Returns the list of network filters

Usage
   nwfilter-list

Options
   Needs to be written

Availability
   Available from libvirt 0.8.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written
2.80. nwfilter-undefine
Undefine a network filter

Usage
nwfilter-undefine

Options
Needs to be written

Availability
Available from libvirt 0.8.0 onwards

Platform or Hypervisor specific notes
None yet

Examples
Needs to be written

Example in context
Needs to be written

See also
Needs to be written

2.81. pool-autostart
Enable or disable the automatic starting of a storage pool, when the libvirt daemon starts

Usage
pool-autostart

Options
Needs to be written

Availability
Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes
None yet

Examples
Needs to be written

Example in context
Needs to be written

See also
Needs to be written

2.82. pool-build
Build a storage pool
2.83. pool-create-as
Create and start a transient storage pool, that will not persist across system restarts, using settings passed as options

Usage
pool-create-as

Options
Needs to be written

Availability
Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes

Needs to be written

2.85. pool-define-as

Add a new persistent storage pool to the configuration, without starting it, using settings passed as options

Usage

pool-define-as

Options

Needs to be written

Availability

Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

See also

Needs to be written

2.86. pool-define

Add a new persistent storage pool to the configuration, without starting it, using settings from an XML file
Usage
   pool-delete

Options
   Needs to be written

Availability
   Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.87. pool-delete
Delete a storage pool

Usage
   pool-delete

Options
   Needs to be written

Availability
   Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.88. pool-destroy
Shuts down a storage pool (from the libvirt point of view), releasing any resources in use by it

Usage
   pool-destroy
2.89. pool-dumpxml
Displays the XML configuration for a storage pool (to stdout)

Usage
   pool-dumpxml

Options
   Needs to be written

Availability
   Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.90. pool-edit
Allows the user to edit the XML configuration of a storage pool, using their preferred editor

Usage
   pool-edit

Options
   Needs to be written
Availability
   Available from libvirt 0.4.6 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.91. pool-info
Returns basic information about a storage pool

Usage
   pool-info

Options
   Needs to be written

Availability
   Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.92. pool-list
Displays a list of the storage pools libvirt is aware of

Usage
   pool-list

Options
   Needs to be written

Availability
   Available from libvirt 0.4.1 onwards
2.93. pool-name
When given a pool UUID, returns the name of the corresponding storage pool

Usage

```
pool-name
```

Options

```
Needs to be written
```

Availability

Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes

None yet

Examples

```

```

Example in context

```
Needs to be written
```

See also

```
Needs to be written
```

2.94. pool-refresh
Re-examines the storage in a storage pool, updating the internal list of volumes present and their details

Usage

```
pool-refresh
```

Options

```
Needs to be written
```

Availability

Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes

None yet
2.95. pool-start
Starts a (previously defined) inactive storage pool

Usage
pool-start

Options
Needs to be written

Availability
Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes
None yet

Examples
Needs to be written

Example in context

### 2.112. setmaxmem

Change the maximum memory allocation limit in the guest domain

Usage
   - `setmaxmem`

Options
   - Needs to be written

Availability
   - Available from libvirt 0.1.4 onwards

Platform or Hypervisor specific notes
   - None yet

Examples
   * Needs to be written

Example in context
   * Needs to be written

See also
   * Needs to be written

### 2.113. setmem

Change the current memory allocation in the guest domain

Usage
   - `setmem`

Options
   - Needs to be written

Availability
   - Available from libvirt 0.1.4 onwards

Platform or Hypervisor specific notes
   - None yet

Examples
   * Needs to be written
Example in context

Needs to be written

See also

Needs to be written

### 2.114. setvcpus

Change the number of virtual CPUs in the guest domain

Usage

```
setvcpus
```

Options

Needs to be written

Availability

Available from libvirt 0.0.1 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

2.118. snapshot-delete
Removes a snapshot, and all of it's children, from a domain

Usage
   snapshot-delete

Options
   Needs to be written

Availability
   Available from libvirt 0.8.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

2.119. snapshot-dumpxml
Displays the XML fragment for a domain snapshot

Usage
   snapshot-dumpxml

Options
   Needs to be written

Availability
   Available from libvirt 0.8.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

Example in context

   *Needs to be written*

See also

   *Needs to be written*

---

**2.122. start**

Start a guest domain, either from the last managedsave state, or via a fresh boot if no managedsave state is present

Usage

   **start**
Chapter 2. Index of commands

Options

* Needs to be written

Availability

Available from libvirt 0.1.6 onwards

Platform or Hypervisor specific notes

* None yet

Examples

* Needs to be written

Example in context

* Needs to be written

See also

* Needs to be written

### 2.123. suspend

Suspend a running guest domain

Usage

```
suspend
```

Options

* Needs to be written

Availability

Available from libvirt 0.0.1 onwards

Platform or Hypervisor specific notes

* None yet

Examples

* Needs to be written

Example in context

* Needs to be written

See also

* Needs to be written

### 2.124. ttyconsole

Output the device for the TTY console

Usage

```
ttyconsole
```

Options

* Needs to be written
2.125. **undefine**
Remove the configuration for an inactive guest domain

**Usage**
```
undefine
```

**Options**
```
Needs to be written
```

**Availability**
Available from libvirt 0.1.6 onwards

**Platform or Hypervisor specific notes**
```
None yet
```

**Examples**
```

```

**Example in context**
```
Needs to be written
```

**See also**
```
Needs to be written
```

2.126. **update-device**
Update device from an XML file

**Usage**
```
update-device
```

**Options**
```
Needs to be written
```

**Availability**
Available from libvirt 0.8.0 onwards
2.127. uri
Display the hypervisor canonical URI

Usage
\texttt{uri}

Options
\textit{Needs to be written}

Availability
Available from libvirt 0.3.0 onwards

Platform or Hypervisor specific notes
\textit{None yet}

Examples
\textit{Needs to be written}

Example in context
\textit{Needs to be written}

See also
\textit{Needs to be written}

2.128. vcpucount
Returns the number of virtual CPUs used by a guest domain

Usage
\texttt{vcpucount}

Options
\textit{Needs to be written}

Availability
Available from libvirt 0.8.5 onwards

Platform or Hypervisor specific notes
\textit{None yet}
2.129. vcpuinfo

Returns basic information about a guest domains virtual CPUs

Usage

vcpuinfo

Options

Needs to be written

Availability

Available from libvirt 0.1.4 onwards

Platform or Hypervisor specific notes

None yet

Examples

Needs to be written

Example in context

Needs to be written

See also

Needs to be written

2.130. vcpupin

Pin guest domain virtual CPUs to physical host CPUs

Usage

vcpupin

Options

Needs to be written

Availability

Available from libvirt 0.1.4 onwards

Platform or Hypervisor specific notes

None yet

Examples

### 2.131. version
Display the system version information

Usage
   **version**

Options
   Needs to be written

Availability
   Available from libvirt 0.0.1 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written

See also
   Needs to be written

### 2.132. vncdisplay
Output the IP address and port number for the VNC display

Usage
   **vncdisplay**

Options
   Needs to be written

Availability
   Available from libvirt 0.2.0 onwards

Platform or Hypervisor specific notes
   None yet

Examples
   Needs to be written

Example in context
   Needs to be written
See also

Needs to be written

### 2.133. vol-clone

Copies an existing storage volume, including data, to a new storage volume

**Usage**

```bash
vol-clone
```

**Options**

Needs to be written

**Availability**

Available from libvirt 0.6.4 onwards

**Platform or Hypervisor specific notes**

None yet

**Examples**

### 2.134. vol-create-as

Creates a new storage volume, on a given storage pool, using settings passed as options

**Usage**

```bash
vol-create-as
```

**Options**

Needs to be written

**Availability**

Available from libvirt 0.4.1 onwards

**Platform or Hypervisor specific notes**

None yet

**Examples**

Needs to be written

**Example in context**

Needs to be written

See also

Needs to be written
2.135. **vol-create-from**
Create a new storage volume from an existing storage volume

Usage

```
vol-create-from
```

Options

```
Needs to be written
```

Availability

Available from libvirt 0.6.4 onwards

Platform or Hypervisor specific notes

```
None yet
```

Examples

```

See also

```
Needs to be written
```

2.136. **vol-create**
Create a new storage volume, on a given storage pool, using settings from an XML file

Usage

```
vol-create
```

Options

```
Needs to be written
```

Availability

Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes

```
None yet
```

Examples

```
Needs to be written
```

Example in context

```
Needs to be written
```

See also

```
Needs to be written
```

2.137. **vol-delete**
Removes a storage volume from a storage pool
2.138. **vol-dumpxml**
Displays the XML configuration for a storage volume, to stdout

Usage
```
vol-dumpxml
```

Options
```
Needs to be written
```

Availability
```
Available from libvirt 0.4.1 onwards
```

Platform or Hypervisor specific notes
```

Example in context
```
Needs to be written
```

See also
```
Needs to be written
```

2.139. **vol-info**
Returns basic information about a storage volume

Usage
```
vol-info
```

Options
```
Needs to be written
```

Availability
```
Available from libvirt 0.4.1 onwards
```

Platform or Hypervisor specific notes
```
None yet

Chapter 2. Index of commands

2.140. **vol-key**

When given a storage volume name or path, returns the corresponding key for that volume.

Usage

`vol-key`

Options

*Needs to be written*

Availability

Available from libvirt 0.4.1 onwards

Platform or Hypervisor specific notes

*None yet*

Examples

*Needs to be written*

Example in context

*Needs to be written*

See also

*Needs to be written*

2.141. **vol-list**

Displays a list of the storage volumes libvirt is aware of, in a given storage pool.

Usage

`vol-list`

Options

*Needs to be written*
### 2.142. vol-name

When given a storage volume path or key, returns the corresponding name for that volume

#### Usage

```
vol-name
```

#### Options

`Needs to be written`

#### Availability

Available from libvirt 0.4.1 onwards

#### Platform or Hypervisor specific notes

`None yet`

#### Examples

`Needs to be written`

#### Example in context

`Needs to be written`

#### See also

`Needs to be written`

### 2.143. vol-path

When given a storage volume name or key, returns the corresponding path for that volume

#### Usage

```
vol-path
```

#### Options

`Needs to be written`

#### Availability

Available from libvirt 0.4.1 onwards
2.144. **vol-pool**

Returns the storage pool name or UUID for a given storage volume

**Usage**

`vol-pool`

**Options**

*Needs to be written*

**Availability**

Available from libvirt 0.8.2 onwards

Platform or Hypervisor specific notes

*None yet*

**Examples**

*Needs to be written*

**Example in context**

*Needs to be written*

**See also**

*Needs to be written*

2.145. **vol-wipe**

Ensure data previously on a volume is not accessible to future reads

**Usage**

`vol-wipe`

**Options**

*Needs to be written*

**Availability**

Available from libvirt 0.8.0 onwards

Platform or Hypervisor specific notes

*None yet*

Appendix A. Revision History

Revision 2-0  Wed Jan 05 2011  Justin Clift jclift@redhat.com
Added the content for the memtune command, provided by Nikunj A. Dadhania.

Revision 1-0  Wed Dec 07 2010  Justin Clift jclift@redhat.com
Added a description for every virsh command, along with the version of libvirt where it became available.

Revision 0-0  Wed Nov 10 2010  Justin Clift jclift@redhat.com
Initial content added, covering the Virtual Networking commands.
